

IN THE CLAIMS

Claim 1. (currently amended) A container comprising:

a first container portion having a wall defining an interior and an exterior of the first container portion; and

a second container portion having a wall defining an interior and an exterior of the second container portion, the wall of the second container portion defining a side wall of the second container portion that terminates at a top of the second container portion such that the second container portion does not have a shoulder or a neck at the top of the second container portion, the exterior of the second container portion being spaced apart from the exterior of the first container portion via a connecting portion, the second container portion being fixedly connected to the first container portion solely along a length of a single side of the second container portion by the connecting portion, the first container portion, second container portion and connecting portion being co-molded.

Claim 2. (original) The container of claim 1, wherein the first container portion has an inwardly directed depression formed in a lower portion of the wall of the first container portion.

Claim 3. (original) The container of claim 1, wherein the second container portion has an inwardly directed depression formed in a lower portion of the wall of the second container portion.

Claim 4. (original) The container of claim 1, wherein the connecting portion is formed at a height above the bottom of the first container portion.

Claim 5. (original) The container of claim 1, wherein the second container portion has at least one reinforcement formed in the wall of the second container portion.

Claim 6. (original) The container of claim 5, wherein the reinforcement comprises at least one rib formed in the wall of the second container portion.

Claim 7. (original) The container of claim 5, wherein the reinforcement comprises at least one crease formed in the wall of the second container portion.

Claim 8. (original) The container of claim 5, wherein the reinforcement comprises a lip formed at or around a top of the wall of the second container portion.

Claim 9. (original) The container of claim 1, wherein the first container portion comprises a plurality of chambers.

Claim 10. (original) The container of claim 1, wherein the first container portion comprises a handle.

Claim 11. (original) The container of claim 1, wherein the connecting portion comprises at least one reinforcement formed therein.

Claim 12. (original) The container of claim 1, wherein the container is formed by blow-molding.

Claim 13. (original) The container of claim 1, wherein the container is used with a material delivery device.

Claim 14. (original) The container of claim 1, wherein the material delivery device is at least one of a spout extension, a spray nozzle and a funnel.

Claim 15. (currently amended) A method of forming a container, the method comprising the steps of:

co-molding a wall defining an interior and an exterior of a first container portion, a wall defining an interior and an exterior of a second container portion, the wall of the second container portion defining a side wall of the second container portion that terminates at a top of the second container portion such that the second container portion does not have a shoulder or a neck at the top of the second container portion, the second container portion being fixedly connected to the first container portion solely along a length of a single side of the second container portion by the connecting portion, and a connecting portion integral to and spacing apart the exteriors of the first container portion and the second container portion.

Claim 16. (original) The method of claim 15, wherein the connecting portion is formed with at least one reinforcement therein.

Claim 17. (original) The method of claim 15, wherein the container is formed by blow molding.
